STARFRAME

YOUR FIRST 5 MINUTES

BUILD > PRACTISE > DEPLOY

QUICK START / 07 NOV 2026

1 BUILD & SAVE

01 EDIT SHIP to build, or **BLUEPRINTS** to load a saved ship. Cards show **COST**.

02 Fit a **core, power, thrusters and weapons**. Connect the hull; keep exhausts and launch paths clear. Direct guns face the core's nose.

03 SAVE, then use **TEST FLIGHT** first. For a mission: **PLAY**, choose ship/difficulty, stay within budget, then **START**.

Left click	Place; X toggles delete mode
Space	Open / close module catalogue
R	Rotate selected module
Alt + click	Copy a module to your hand
M	Mirror about the core; both sides must fit
P	Open / close WEAPON GROUPS
Middle drag	Orbit; Shift + drag pans
Wheel / F	Zoom / frame the whole ship

MAKE FIRE BUTTONS WORK

In **WEAPON GROUPS**, drag a weapon to a group and **release** to assign it. A group click only shows its members. New/default groups: **1 = direct guns / left mouse**, **2 = missiles / right mouse**. Saved ships may use different bindings.

2 PRACTISE & FIGHT

TRAINING RANGE: SELECT TARGET, set ATTACK and MOVE, then ENTER. Try movement and weapons here before deploying.

W / S	Forward / backward thrust
A / D	Strafe left / right
Space / Ctrl	Rise / descend
Q / E	Roll left / right
Mouse	Steer the ship
Hold Shift	Boost; high energy use
Left / right mouse	Fire their assigned weapon groups
F	Lock / unlock target ahead
Tab	Deploy a fitted, ready flare launcher
1 - 8	Toggle weapon groups ON / OFF
V	Direct-shot salvo / alternating cadence
Wheel / Esc	Camera distance / pause & options

Mouse offset is a **continuous turn command**. Bring it back toward the centre to ease the turn. Releasing movement keys engages automatic braking.

YOUR MISSION

Defeat **all 6 waves** and remaining enemies. The final wave brings the **t8 flagship + escorts**. Your core being destroyed ends the sortie. Repair the design and redeploy.

3 READ THE FIGHT

RED TARGETS Radar contacts; F selects your main target.

SHIELD Absorbs hits. It recovers using energy.

ENERGY Powers propulsion, weapons and shield recovery.

WEAPON CELLS Bright = ready. Dim / a number = unavailable or reloading.

HEAT Gatling orange heat rises during fire. After overheating, cool to empty to fire again.

AIM, FIRE, RECOVER

Beams: aim at the ship. **Projectile guns**: use the red lead marker for moving targets. Slight assistance corrects mounting offset only.

Regular missiles: F-lock a target, wait for missile acquisition, then hold the missile group's fire button. Reloading missiles must acquire again.

VLS: keep radar-marked enemies in view for **4 seconds**, then fire its group. It splits the magazine across targets; each unit reloads independently.

Low energy? Release boost and stop firing briefly. Shield recovery gets power first, then propulsion, then weapons. Boost raises the speed limit; releasing it restores the normal limit.

Default keys shown. Settings can rebind flight actions; weapon fire bindings belong to each blueprint. I ? / HELP explains the current screen.
