Pilot quick start

Build a ship. Fly a sortie. Refine your blueprint.

01 Your first sortie

01 Open Ship Assembly from the hangar. Use your current ship or load one from Blueprint Library.

02 Fit a core, power, thrusters and weapons. Check Handling & Power; keep weapon muzzles and thruster exhausts clear.

03 Save a named blueprint. Return to the hangar, choose the mission, then check the ship and budget before confirming deployment. Use Test Flight / range setup to practise first.

02 Assembly controls

Left click	Place the selected module
R	Rotate the placement preview
X + left click	Toggle delete mode, then remove a part
Hold middle mouse	Orbit the ship
Shift + middle mouse	Pan the view
Mouse wheel	Zoom in / out
F	Frame the whole ship

Blueprints & weapon groups

Save Blueprint stores the current design. Blueprint Library loads or deletes saved designs; an existing name asks before overwriting.

Open Weapon Groups, select a weapon in the 3D preview, assign its group and set that group's fire key. Apply your changes before leaving.

03 Flight controls

W / S	Forward / backward thrust
A / D	Left / right thrust
Space / Ctrl	Up / down thrust
Q / E	Roll left / right
Mouse movement	Continuous steering input
Hold Shift	Boost; consumes energy
Left mouse	Fire enabled groups (default binding)
F	Lock / unlock the target ahead
R	Deploy one ready flare launcher
V	Ballistic salvo / alternating fire
1 - 8	Enable / disable each weapon group
Mouse wheel	Adjust chase-camera distance
Esc	Pause / options / exit

04 Aim & survive

Aim at a red target marker and press F. With a lock, use the lead indicator for moving targets. Missiles also need their weapon lock to complete.

Mouse offset is a sustained turn command: move back toward the centre to stop turning. The ship turns at its own capability; releasing movement input engages braking.

All weapon groups start enabled. Number keys only toggle groups; their assigned fire keys actually fire them. V affects ballistic guns, not beams or missiles.

Watch shield and energy gauges. Use flares when a missile is incoming; each launcher needs clear space above and has its own cooldown.

Default bindings shown. Settings can rebind flight actions; weapon fire keys belong to each blueprint.
